## **DETAILED ACTION**

### ***Election/Restrictions***

1. Restriction to one of the following inventions is required under 35 U.S.C. 121:
  - I. Claims 1-17, 29-36 drawn to a method/system to access memory by traversing a queue of commands containing a Next Valid Write Address pointer, classified in class 711, subclass 213.
  - II. Claims 18-28, drawn to processor for issuing commands in a queue, classified in class 712, subclass 214.
2. Inventions II and I are related as combination and subcombination. Inventions in this relationship are distinct if it can be shown that (1) the combination as claimed does not require the particulars of the subcombination as claimed for patentability, and (2) that the subcombination has utility by itself or in other combinations (MPEP § 806.05(c)). In the instant case, the combination as claimed, group II, does not require the particulars of the subcombination as claimed, group I, because a processor can issue commands in a queue to access memory without implementing a system of generating and using Next Valid Write Address pointer field in queue entries. The subcombination, group I, has separate utility such as detecting WAR (write after read) and RAW (read after write) conflicts; and providing pre-fetch logic for subsequent write commands.
3. Because these inventions are distinct for the reasons given above and have acquired a separate status in the art as shown by their different classification, restriction for examination purposes as indicated is proper.
